

Lehigh County Authority – Allentown Division

2020 Flushing Program

In our effort to provide our customers with high quality drinking water, Lehigh County Authority maintains a water main flushing program. During flushing operations, fire hydrants and blow-offs are systematically opened around the District and water is allowed to flow quickly through the pipes. This increased velocity scours and cleans the pipe walls, flushes sediment from the mainline pipes, and removes aging water from the distribution system. It also verifies the proper operation of hydrants and valves, maintains firefighting capability, and ultimately improves water quality.

When and where will LCA be conducting water system flushing?

Our crews flush neighborhoods on a regular rotation. We will be posting a notice in our quarterly billing newsletter and on our website at www.lehighcountyauthority.org. A tentative flushing schedule for 2020 is shown on page 2.

Customer Information:

Some key elements to be included in the customer notification about LCA's flushing program are shown below.

What should you do when LCA is flushing in your area?

If you see a crew flushing a hydrant on your street, *avoid running tap water, using the washing machine, or running the dishwasher until the flushing is complete* to avoid drawing discolored water into your home plumbing. If possible, completely avoid using your hot water as this may draw discolored water into your hot water heater allowing the discoloration to persist for long periods of time.

Safety Notice: If you see hydrant flushing crews working in the area, please drive carefully and treat them like any other road construction crew.

What should you do after flushing in your area is completed?

After the flushing has completed in your area, turn on your cold water tap. If you encounter discolored water, shut the water off and wait several minutes before you turn on your cold water tap again. Running the tap for a few minutes will allow new water to work its way into your pipes. Please be aware that in some cases, there may be slight discoloration of the water for a few hours. If doing laundry after flushing, start with a dark load on cold water. If the pressure or volume of the water seems low, check your faucet screens for trapped particles.

Brown Water Notice: Discoloration of your water after system flushing only affects the appearance of the water. There is no health risk associated with the discoloration of water after system flushing. However, if brown water persists for a long period of time after system flushing is completed (more than a few hours), feel free to contact LCA at 610-437-7515.
